SOURCE CODE: UR/0226/66/000/004/0065/0068

AUTHOR: Kazakov, V. K.; Gorodetskiy, S. S.ORG: Institute of the Problems of the Science of Materials, AN SSSR (Institut problem materialovedeniya AN SSSR)TITLE: Mechanical properties of $\text{SiC-Si}_3\text{N}_4$ base materialsSOURCE: Poroshkovaya metallurgiya, no. 4, 1966, 65-68

TOPIC TAGS: intermetallic compound alloy, silicon carbide alloy, sintered alloy, silicon carbide containing alloy, silicon nitride containing alloy, alloy property, silicon nitride alloy

ABSTRACT: The dependence¹⁸ of the mechanical properties of sintered $\text{SiC-Si}_3\text{N}_4$ alloys on composition, sintering temperature, and addition of strengthening compounds has been investigated. All alloys were prepared from silicon nitride²⁷ (57.4% Si, 32.7% N) mixed with 20, 46.7, 65.3, or 78 mol% SiC powder (containing 97.3% SiC), compacted and sintered in a nitrogen atmosphere at 1600–1650°C. The sintered alloys had a porosity of 25–30%. The compression and bend strength of sintered $\text{SiC-Si}_3\text{N}_4$ alloys does not change substantially with variations in sintering temperature from 1600 to 1630°C, but decreases with an increase of sintering temperature over 1630°C because of the decomposition of silicon nitride. Al_2O_3 , MgO , or TiO_2 added to the mixture in the amount of 10 wt% increase the strength of the alloys, but SiO_2 decreases it

Card 1/2

L 24199-66

ACC NR: AP6012774

because of intense evaporation of silicon dioxide at 1600—1650°C. Nonroasted titanium oxide (white) increases the strength of sintered parts. Roasted titanium oxide (yellow) lowers the strength of sintered parts, but makes it possible to obtain parts with approximately the same strength in the 1600—1650 range of sintering temperatures. The experimental results show that 1600—1630°C is the optimal temperature range for sintering SiC-Si₃N₄ material, and that the mechanical properties of the material are high in the entire investigated range of compositions from 20 to 78 mol% SiC. Orig. art. has: 4 figures and 2 tables. [MS]

TITLE: Nature of the interaction between titanium nitride and metals of the iron group and molybdenum and tungsten

SOURCE: Poroshkovaya metallurgiya, no. 10, 1965, 80-84

TOPIC TAGS: titanium nitride, iron, cobalt, nickel, molybdenum, tungsten, sintering, solubility, hardness

ABSTRACT: The authors present the results of a preliminary investigation of this interaction. Powders of TiN (76.4 wt.% Ti and 19.5 wt.% N) were separately mixed with commercial-purity powders of Fe, Co, Ni, Mo, and W in a ball mill. The alloys of TiN with metals of the iron group were prepared by pressing and sintering the mixtures, and the alloys of TiN with Mo and W were prepared by hot pressing in graphite molds. A determination of the linear shrinkage of the specimens following their sintering at 1400-1500°C showed that the shrinkage was 1-2% regardless of sintering time; at 1600-1900°C the shrinkage increased to ~3% for TiN-Fe, ~5% for TiN-Ni, ~9% for TiN-Co, which gives reason to believe that molten Co has a greater wetting effect on TiN than Ni and Fe. Microstructural examination showed that new phases form in alloys of TiN with W, Mo, Fe, Co, and Ni. The microhardness of these

Card 1/2

090102 85

L 5320-56

ACC NR: AP5026276

new phases is markedly lower than that of the TiN phase, and the strength of the TiN-Fe and TiN-Co alloys was found to be low. The grain boundaries of TiN are distinct and indicate the lack of solubility of TiN in the metals, as well as of the metals in TiN. The lack of interaction between TiN and these metals is indicated by the low shrinkage of the specimens, their limited strength, and the unchanged microhardness of TiN. AUTHOR: Samsonov, G. V.; Kazakov, V. K.

TITLE: Boron nitride - silicon nitride and boron nitride - silicon carbide refractories

SOURCE: Ogneupory, no. 7, 1965, 30-35

TOPIC TAGS: boron nitride refractory, silicon nitride refractory, silicon carbide refractory, powder metallurgy, fused borax, molten zinc

ABSTRACT: The specimens were prepared from BN-Si and BN-Si₃N₄ powder-mixtures in which the components were present in amounts such that the final product would contain 20, 40, 60, and 80 mole % BN. The powder mixtures were pressed and sintered for 2-3 hr. at 1550°C in nitrogen, hydrogen, and air. The BN-Si samples were first heated at 1350°C to nitride the silicon. X-ray structural analysis did not reveal any differences in the BN-Si and BN-Si₃N₄ samples. The BN-Si₃N₄ system contains four phases: BN, β -Si₃N₄, Si₂ON, and a slight amount of α -Si₃N₄. Some mechanical properties of the BN-Si₃N₄ refractories obtained are tabulated; their transverse strength (at a high content of Si₃N₄) is much greater than that of carbon-bonded refractories with a nitride binder. The oxidation resistance of the materials was also studied. BN-Si₃N₄ refractories were attacked by fused borax only half as fast as

Card 1/2

4

Si₃N₄-SiC refractories. Tests of the effect of molten zinc on BN-Si₃N₄, Si₃N₄, Si₃N₄-SiC, TiC, ZrC, and TiN showed that BN-Si₃N₄ is the most resistant material. SiC-BN specimens were prepared by sintering for 1-2.5 hr. at 2200-2490°C. Depending upon the sintering temperature, the products either were two-phase alloys with new phases (2200-2350°C) or contained the original components (2250°C). Physicochemical properties were determined. Applications of the synthesized refractories are listed. Some of the tests were carried out at the Vsesoyuzny nauchno-issledovatel'skiy institut elektrotermicheskogo oborudovaniya (All-Union Scientific Research Institute for Electrothermal Equipment) and the Leningradskiy zavod im. D. I. Mendeleyeva (Leningrad Plant). Orig. art. has: 4 figures and tables.

AUTHOR: Kazakov, V. K.

TITLE: Preparation of refractories from carborundum with a nitride binder and from silicon nitride - SiC materials

SOURCE: Poroshkovaya metallurgiya, no. 7, 1965, 58-66

TOPIC TAGS: refractory, carborundum, silicon nitride, silicon carbide, nitride binder

ABSTRACT: The mixtures were prepared from silicon carbide (SiC 97.3%), silicon nitride (9.9% impurities, 0.85% Si), and silicon (99.31% Si) powders, pressed, and sintered at 1600°C for 2 - 4 hrs. The density, porosity, and mechanical properties of the various Si_3N_4 -SiC compositions are tabulated. It was found that the refractories obtained have a porosity of 25-30%, average thermal expansion coefficient of 7×10^{-6} $\text{cm}/\text{cm}^2 \cdot ^\circ\text{C}$, a 1000°C strength of 17.1 dan/mm², tensile strength in the $1000-1200^\circ\text{C}$ range, transverse strength of 7.1 dan/mm², tensile strength of 3.9 dan/mm², and electrical resistance at 20°C of 5×10^9 ohm-cm. The process produces Si_3N_4 -SiC refractories containing from 20 to 80 mole % Si_3N_4 . The sintering time and energy consumption amount to one-half of those required by the direct sintering method. These refractories are used in making open-mesh filters for metallurgical plants.

AUTHOR: KAZAKOV, V.P. PA - 2835
TITLE: Some Problems of Design of Multi-Channel Feedback Control Systems.
(Nekotoryye voprosy postroyeniya mnogokanal'nykh sistem avtomaticheskogo regulirovaniya, Russian)
PERIODICAL: Avtomatika i Telemekhanika, 1957, Vol 18, Nr 4, pp 324 - 335 (U.S.S.R.)
Received: 5 / 1957 Reviewed: 6 / 1957

ABSTRACT: Two selection principles may be used in multi-channel systems of regulation (MSR). The first - the frequency principle - requires complicated schematical and constructive solutions. The second - the time principle - is widely used in remote control and all known MSR. Successive closing of the circuit takes place by means of switching, which is one of the basic elements in such systems. A periodic short-timed closing of the current circuit of the input signals is useful for forming the error-impulse signal in a rapid MSR. Some possible solutions are shown here for the following problems in the case of the regulation of a large number of channels (of the order of magnitude 100), where processes with frequencies of up to 0,5 - 1 ko take place: Forming and switching of impulse signals of the deviation for each channel, connecting of the channels by means of contact-less rapid switches of long life, increase of the duration of the effect of impulse-control signals and correction of the regulating processes in the MSR. The impulse-correction device in the MSR permits the regulation of a group of objects with

TITLE: Optical spectra of $\text{CaF}_2(\text{Tb})$ crystals

SOURCE: Zhurnal prikladnoy spektroskopii, v. 4, no. 2, 1966, 147-156

TOPIC TAGS: phosphor, terbium, calcium fluoride, luminescence spectrum, absorption spectrum

ABSTRACT: The authors studied the absorption and luminescence spectra of a number of fluorite crystals activated by terbium oxide, hydroxyfluorides, and fluorides in concentrations from 0.01 to 5 mol.%. The specimens were polished cylinders 12 mm in diameter and 24-28 mm long with parallel faces. A mercury lamp was used for luminescence excitation with a light filter for isolating the 290-360 μm region. A DFS-12 spectrograph was used for taking the luminescence spectra with an optical slit of 0-11.11 \AA in width at temperatures of 300 and 77°K in the 3600-6500 \AA range. The absorption spectra were taken at room temperature. A

ACC NR: AP6006964

mercury lamp with a wavelength of 265 μ m isolated by a monochromator with a quartz prism was used for excitation of the specimens in measurements of the relative luminescence intensity as a function of concentration. Variations in the optical spectra are analyzed as functions of the chemical composition and concentration of the activator. The experimental data indicate that the variations in crystal spectra caused by changes in impurity concentration are due to interaction between the terbium ions forming cation pairs. It is shown that the ratio of the relative luminescence intensities of the crystals to the coefficient of absorption is a linear function of impurity concentration. The problem of interaction between an isomorphic impurity and crystal defects is discussed. "In conclusion the authors are grateful to Ye. V. Sobolev and M. V. Konovalova for assistance in the work." TITLE: Chemiluminescence of some reactions in concentrated sulfuric acid

SOURCE: Zhurnal fizicheskoy khimii, v. 39, no. 12, 1965, 2936-2941

TOPIC TAGS: chemiluminescence, sulfuric acid, uranium compound, photomultiplier/M12FS35 photomultiplier, FEU-18 photomultiplier

ABSTRACT: The chemiluminescence was recorded with a type M12FS35 photomultiplier with a type EPPV-60 automatic recorder. Chemically pure reagents were used. The spectrum of the chemiluminescence was taken with a type UM-2 monochromator and the light was recorded with a type FEU-18 photomultiplier. Experimental results are shown in a series of curves. The following new chemiluminescent systems were found:
1) reactions of the products of the electrolysis of sulfuric and phosphoric acids near the anode in the presence of salts of UO_2^+ , Ce(III), Tb(III), and quinine; and, 2) the reaction of strong oxidizers--ozone and sodium bismuthate with a solution of UO_2SO_4 in concentrated

UDC: 535.37

ACC NR: AP6014892

sulfuric acid. The reaction of the final products of the electrolysis of $H_2S_2O_8$, H_2O_2 , and H_2SO_4 with a solution of UO_2SO_4 is not a source of chemiluminescence. Solution of $UO_2 \cdot 2H_2O$ in acid does not produce light. The article proposes a mechanism consisting of the recombination of SO_4^{2-} ion radiocls with the participation of UO_2^{2+} , Tb^{3+} , and Ce^{3+} complexes in sulfuric acid. Orig. art. has: 6 figures.

SOURCE: Teoreticheskaya i eksperimental'naya khimiya, v. 2, no. 3, 1966, 376-383

TOPIC TAGS: chemiluminescence, rare earth element, luminescence attenuation

ABSTRACT: It has been found that the rare earth oxides in sulfuric acid solutions show chemiluminescence in the visible and ultraviolet regions when treated with the electrolysis products of H_2SO_4 . The analysis of the luminescence attenuation curve indicates that the process leading to luminescence follows the bimolecular law and that its linear anamorphosis can be expressed by coordinates. A possible processing procedure is discussed, including participa-

TITLE: The Effect of the Phase Condition of Polyethylene During Irradiation Upon the Type of the Resulting Network

PERIODICAL: Vysokomolekulyarnyye soyedineniya, 1960, Vol. 2, No. 10,
pp. 1512-1520

TEXT: The authors studied the dependence of radiation cross linking on the state of low-pressure polyethylene. Polyethylene samples were irradiated in thin-walled aluminum containers in the presence of helium in the reactor (dose 150 - 1625 Mrad). Crystalline samples were irradiated at 45 - 50°C, and amorphous, molten samples at 130-160°C. A table gives the change of the melting point caused by irradiation, the change of the vitrification temperature, and of the high-elasticity module E_{∞} . Fig. 1 shows E_{∞} as a function of temperature, Fig. 2 thermomechanical curves of the samples irradiated, Fig. 3 E_{∞} as a function of the irradiation dose, and Fig. 4 the nonmonotonous dependence of the melting point T_m

Card 1/2

The Effect of the Phase Condition of Polyethylene S/190/60/002/010/011/026
During Irradiation Upon the Type of the Resulting B004/B054
Network

on the dose. The authors found that the crystallization properties of irradiated polyethylene strongly depend on its phase condition during irradiation. Irradiation in a molten state led to a fast drop of T_m and a decrease of the crystallization degree. On irradiation in a crystalline state, the authors first observed a slight drop of T_m , then a constant value, and then a slight increase. The crystallization degree decreased more slowly than on irradiation of melts. These effects are interpreted as different types of network in the amorphous and crystalline states. In the amorphous state, the network fixes the disordered state of chains. In crystalline samples, however, the cross links fix the local order of polymer chains. This effect corresponds to the effect of increase of T_m in rubbers when their chains are oriented. There are 4 figures, 1 table, and 18 references: 7 Soviet, 7 US, and 3 British.

noy Energii im. I. V. Kurchatova AN SSSR)

TOPIC TAGS: Crystalline polymer, radiation chemistry, amorphous polymer,
polyethylene

PURPOSE AND COVERAGE: Data concerning the influence of radiation "stitching" on
the melting point of polyethylene crystals are contradictory: both a lowering with
increasing dosage and practical constancy have been observed. This discrepancy
may be due to the difference in temperatures at which irradiation has been per-
formed. The lattice being formed may have a different character during irradia-
tion in the crystalline state than during irradiation in the amorphous state,
despite the approximately identical consistency, and may affect the melting point

The origin of the rich chernozem soils in Western Siberia. V. B. Kazakov. *Problemy Sovet. Pochvovedeniya* 1939, No. 7, 18-21; *Zhurn. Referat. Znat.* 1940, No. 1, 68
—Formation of this chernozem is connected with the chem.-biol. transformation of solonetz soils—from the upper-layer solonetz soils through the medium- and deep-layer solonets soils to the rich chernozem. The absorption capacity of the chernozem is up to 82 mg. equiv./exchange Na 10-20% of the exchange capacity. To accelerate the transformation of the barren solonetz soils into chernozem soils, K. recommends making the solonetz soils acid, adding manure and sowing grass. W. R. H.

Quantitative relationship and ash content of components
of wheat grain. E. D. Kazakov. *Doklady Akad. Nauk
S.S.R.* 58, 1081-2 (1947).—Analyses of various strains of
wheat grain gave the following ranges of component parts
Grain sheaths: 4.8-8.3%, all sheaths 17.38-20.3%; endo-
sperm 75.90-9.19%; embryo 3.4-3.8%. Ash content
values: grain sheaths 2.7-3.4%; all sheaths 5.77-6.47%.
endosperm 0.80-0.48%; embryo 4.48-6.09%; washed grain

| 1.56-1.88%, mech. impurities 0.12-0.18%, original grain
1.68-2.06%.

Changes in fat after many years of grain storage.
K. I. Khagakuy and A. N. Volkova. Doklady Akad.
Nauk S.S.R. 72, 589-90(1950).--When wheat, rye, or
oats is stored 1-10 years the iodine no. of the fat content
gradually declines with time; in oats stored 16 years the
drop was to less than 40% of the original; wheat loses some
40% in 11 years and rye about 25-30%. G. M. K.
